**Keywords:** *Biomedical Sciences; Researcher*

It is an intemperate task that all over the world lots of researchers are flourishing to write many things on 'Biomedical Sciences'. A rivalry competition is still running in this research field and of course this is a good sign for everybody especially newcomer. As regard, all writers are more energetic to fill the demand of research.

In this perspective, [www.cientperiodique.com](http://www.cientperiodique.com) is a diversified, peer reviewed, and a great journal which deals 15 Departments of Medical Science. This journal has lots of experts in different fields. A new researcher can easily open this site in order to write something special.

It is rational that a researcher should follow their seniors always who are well-experienced. Moreover, the knowledge about materials for the experiment is very important. Now, we have lots of congenial information on anything good and all are surely possible to make something new. For human well-being, 'Biomedical Sciences' are more substantial and perpetual. Honesty, plagiarism, and copyright can be followed by a researcher. In particular, a good article can make a real researcher. So, it is mandatory that a new researcher will read many effective articles always. Unfortunately, we have some dearth of better writings. For an effective writing, researcher will follow the mode of work, plausible matters, and rules and regulations of the particular journal. In the research field - type of article, writing style, arrangements, tables, figures, diagrams, and references (bibliography) may vary in different journals. Specifically, result of an article is the original findings of a writer and its comparison with others in discussion are considered the quality of a paper. This is an important session for mentioning the propinquity with other relevant works. Among the articles, a full

length research paper/original article is considered the best writings. Quality research is more important than the quantity. The introduction section will be standard of an article because it ensures the writer(s) previous idea on that particular topic. Writer(s) depth of knowledge, experience on own paper, latest references, more objective and one aim will come in this section. When a reader will read the introduction section they will get a full spirit to read thorough article. Inevitably, a good article always influences to read this type of another article. On the basis of conclusion(s), a writer/researcher of course will highlight some recommendations. This part will reconcile any anomalies. Arbitrary matters are not accepted in scientific world. If above mentioned guidelines are occupied by an author, written article will be standard. Contents of the article will help for writing the summary and then abstract/synopsis will come as a gist. Methods are another important section for a researcher either they are new or old. By following several articles, it is very easy to mention different methods. If a researcher wants to write scientific note, short communication, case study, review article, medical article, and book review but the overall basic things of an article is same - abstract, key word, introduction, material and method, result and discussion, conclusion, recommendation, acknowledgement, and reference. A review article shows an expert who is really a scientist or very specific in a particular field. If a writer writes several articles on a specific topic, it is very easy for them to write an effective review article.

Finally I want to say any new researcher in this field that honesty, more reading, keen observation of a good article, patience, systematic way, good personality, knowledge on literature and language, convincing mentality, and public psychology make ensure a writer's sustainability in this cientperiodique research field. Welcome everybody again for working with us. Thanks for being a great researcher.
